

recycled SS

What is Recycled Stainless Steel?

Stainless steel is a type of metal used in many different products such as appliances, utensils, and even buildings. It is called “stainless” because it doesn’t easily stain or rust, making it a really durable material.

Stainless Steel can be recycled indefinitely, without losing its quality and other properties. The extended life of stainless steel makes it a prominent material in a circular economy.

Advantages recycled SS vs. conventional SS

Reduce waste

Recycled stainless steel is just as strong and durable as new stainless steel. It is used to make new products with the same quality. This means that we can save resources by reusing stainless steel instead of making it from scratch.

Impact:

Recycled Stainless steel saves about 44% of GHG-emissions, compared to the products manufactured from conventional stainless steel.

Certified

Our recycled Stainless Steel products have **The Recycled Claim Standard (RCS)** which verifies recycled material and tracks it from the source to the final product.
